

science

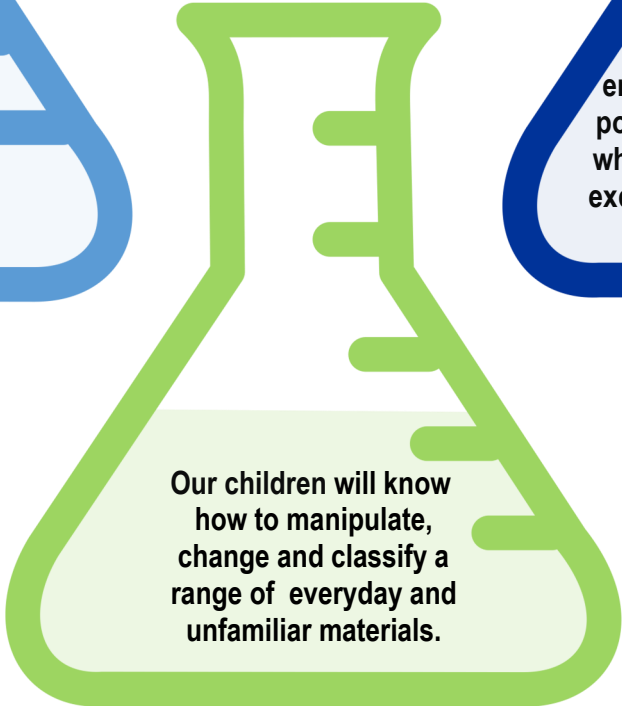

Through an investigative approach to Science, our children are encouraged to understand how science can be used to explain what is occurring, predict how things will behave, and analyse causes.

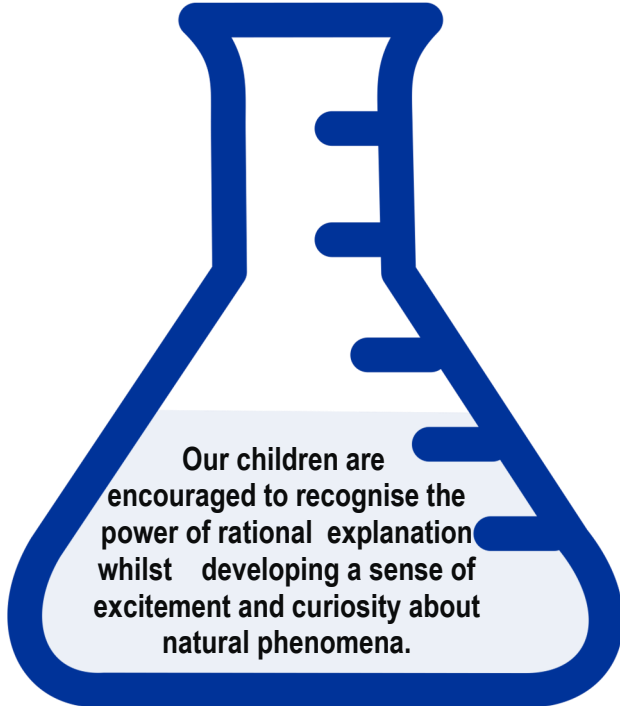

Our children will identify, compare and classify living things, including humans, animals and plants, and know the conditions that these living things need in order to thrive in their environment.

Our children will know how forces work - including electricity, light, sound, magnetism and the solar system – and know their uses in today's world.

Our children will know how to manipulate, change and classify a range of everyday and unfamiliar materials.

Our children are encouraged to recognise the power of rational explanation whilst developing a sense of excitement and curiosity about natural phenomena.
